Code design: Who's running the simulation?

- · Many ways of doing it, but here are two different strategies
 - 1) The main program starts the situalation, of Other part of code runs the complete simulation (loop over time steps) and takes rare of saving vesult in nemory or wite to disk

New output? Modify the "Simulation machine"

- 2) o The main program runs the loop over the time steps.
 - o The Medica simulated system (Perming Trap)
 doesn't contain any it's own history, it it's just
 a system with a current state
 - o The main program is responsible for extracting whatever into it wants at whatever time steps it wants

Personal opinion

- o I find approach

 7) more intuitive

 and flexible
- o Counadity system how I want when I want without changing the Penning Trap code
